There are multiple causes of school refusal (Kearney and Silverman, 1993)

**IDENTIFICATION OF GROUPS OF SCHOOL REFUSAL PROFILES!**

***1) What are the school refusal profiles?***

Limitation considering a homogeneous group

## 1) What are the school refusal profiles?

### Dave and Orpinas (2009)

- 99 US students ( $M=12,5$ ;  $SD=1,38$ ).
- **Three profiles:**
  - ✓ Mixed school refusal profile.
  - ✓ School refusal by positive reinforcement.
  - ✓ Non-school refusal profile.

**LACK OF INVESTIGATIONS IN SPANISH ADOLESCENTS!**

## 2) How is the relation between school refusal and psychoeducational variables?

### ANXIETY

- Negative school refusal behaviour high on anxiety.
- School refusal behaviour (positive reinforcement: III) high separation anxiety disorder.
- School refusal behaviour on tangible reinforcements (IV) positive correlated to behaviour problems.

### SCHOOL ANXIETY

- School refusal behaviour (negative and positive reinforcement) positive predictor of high school anxiety.

### SOCIAL ANXIETY

- School refusal behaviour comorbidity with social anxiety.

### ***3) Which are the characteristics of the school refusal profiles in Spain and Ecuador?***

#### **OBJECTIVES (5 articles)**

- To identify school refusal behaviour profiles in Spanish and Ecuadorian children (quick cluster analysis and latent class analysis).
- Relationship with:
  - ❖ School anxiety.
  - ❖ Depression, anxiety and stress.
  - ❖ Social functioning.
  - ❖ Social anxiety and family functioning.

### 3) Which are the characteristics of the school refusal profiles in Spain and Ecuador?

#### ABSTRACT

Anxiety is a common mental health factor associated with school refusal behaviour. This study aims to identify different school refusal behaviour profiles and to determine whether or not these profiles differ from each other based on three anxiety dimensions (Anticipatory Anxiety, School-based performance anxiety and Generalized Anxiety). Participants were Spanish children ( $N = 1113$ ; 52.3% male) aged 8–11 years ( $M = 9.53$ ;  $SD = 1.10$ ). The School Refusal Assessment Scale-Revised (SRAS-R) and the Visual Analogue Scale for Anxiety-Revised (VAA-R) were administered. Cluster analysis revealed four school refusal behaviour profiles: Non-School refusal, School Refusal by Positive Reinforcement, School Refusal by Negative Reinforcement, and School Refusal by Mixed Reinforcement. The Mixed Reinforcement group was the most maladaptive profile since it obtained the highest mean scores on the three dimensions and the total score of the VAA-R. In contrast, Non-School Refusal and Positive Reinforcement groups revealed the lowest scores in all of the anxiety dimensions. Our findings underscore the idea certain school refusal behaviour profiles have a higher risk of presenting anxious symptoms. In these cases, the control of anxiety may be an important goal of preventive interventions.

On the basis of the heterogeneous causality that characterizes the students who refuse going to school, it is useful to have a classification of this population in homogeneous groups. For this, the aim of this study was, first, to identify by cluster analysis the profiles of school refusal behavior based on the functional model evaluated through the School Refusal Assessment Scale-Revised (SRAS-R). Secondly, it is intended to analyze if there are differences in social functioning scores according to the school refusal profiles identified. This study involved 1212 Spanish children between 8 and 11 years old ( $M=9.12$ ,  $SD=1.05$ ) who completed the SRAS-R to evaluate the school refusal behavior and the Child and Adolescent Social Adaptive Functioning Scale (CASAFS) to assess social functioning. Four profiles were identified: Non-school refusers, School refusers by mixed reinforcements, School refusers by tangible reinforcements and School refusers by negative reinforcements. The profile of Non-school refusers achieved the highest average scores in social functioning, while School refusers by mixed reinforcements group obtained the lowest average scores in social functioning. In general, the profiles found support the clusters identified in previous studies. The implications of social functioning on school refusal behavior are discussed.

**Abstract:** School attendance problems negatively affect students' development. This study attempted to identify different school refusal behavior profiles and to examine their relationship with three dimensions of social anxiety (fear of negative evaluation, social avoidance and distress in new situations, and social avoidance and distress that is experienced more generally in the company of peers) and the perception of family functioning. Participants included 1842 Spanish adolescents (50% girls) aged 15–18 years ( $M = 16.43$ ;  $SD = 1.05$ ). The School Refusal Assessment Scale—Revised (SRAS-R), the Social Anxiety Scale for Adolescents (SAS-A), and the Family APGAR Scale (APGAR: Adaptation, Partnership, Growth, Affection, and Resolve) were administered. Latent class analysis revealed four school refusal behavior profiles: non-school refusal behavior, high school refusal behavior, moderately low school refusal behavior, and moderately high school refusal behavior. Analyses of variance (ANOVA) indicated that adolescents' with the profile of high school refusal behavior showed higher scores in all the subscales of social anxiety. In contrast, the non-school refusal behavior group revealed higher scores in the perception of good family functioning, whereas the high school refusal behavior profile obtained the lowest scores in this scale. These findings suggest that students who reject school are at a higher risk of developing social anxiety problems and manifesting family conflicts. These students should be prioritized in order to attend to their needs, promoting self-help to overcome social anxiety and family problems with the purpose of preventing school refusal behaviors.

**Keywords:** school refusal behavior; social anxiety; family functioning; adolescents; latent class analysis

## 3) Which are the characteristics of the school refusal profiles in Spain and Ecuador?

### STUDY 5

- 1842 students whose ages ranged between 15 and 18 years ( $M = 16.43$ ,  $SD = 1.05$ ) from Alicante and Murcia (Spain).
- The Spanish version of the SRAS-R González et al. (2016)
- Social Anxiety Scale for Adolescents (SAS-A).
- Family APGAR Scale (APGAR; Smilkstein, 1978).
- Latent class analysis.
- Social anxiety: High SRB highest and Non-SRB lowest.
- Family functioning: High SRB lowest and Non-SRB highest.

- Variety of existing school refusal behaviour profiles and attend to their particularities.
- Offering a more targeted response adapted to these characteristics.
- Controlling mixed and negative reinforcement and High SRB groups.
- Improving social skills, developing positive relationships and reducing emotional distress (prevention).
- More research is needed.

thank you!
